# Signal Behaviour of pCVD Diamond Pad Detectors Depending on Incident Particle Flux

ADAMAS Workshop

Michael Reichmann

27th November 2017

# Table of contents

1 Motivation

2 Test Site & Setup

3 Analysis

4 Results

5 Conclusion

## Section 1

### Motivation

## Motivation

- innermost layers → highest radiation damage
- current detector is designed to survive ~12 month in High-Luminosity LHC
- completely new regime of particle flux  $\mathcal{O}(\text{GHz/cm}^2)$
- → **R/D for more radiation tolerant detector designs and/or materials**

# Motivation

- innermost layers → highest radiation damage
- current detector is designed to survive ~12 month in High-Luminosity LHC
- completely new regime of particle flux  $\mathcal{O}(\text{GHz}/\text{cm}^2)$
- → **R/D for more radiation tolerant detector designs and/or materials**

## Diamond as Detector Material:

- advantageous properties
  - ▶ radiation tolerant
  - ▶ isolating material
  - ▶ high charge carrier mobility

# Motivation

- innermost layers → highest radiation damage
- current detector is designed to survive ~12 month in High-Luminosity LHC
- completely new regime of particle flux  $\mathcal{O}(\text{GHz}/\text{cm}^2)$
- → **R/D for more radiation tolerant detector designs and/or materials**

## Diamond as Detector Material:

- advantageous properties
  - ▶ radiation tolerant
  - ▶ isolating material
  - ▶ high charge carrier mobility
- investigation of the rate effect in various detector designs:
  - ▶ pad → full diamond as single cell readout of the whole signal → shown here
  - ▶ pixel → diamond sensors on state-of-the-art pixel chips
  - ▶ 3D → pixel detector with clever design to reduce drift distance

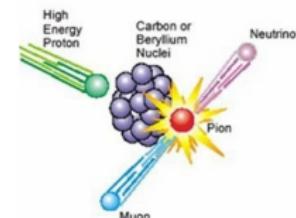

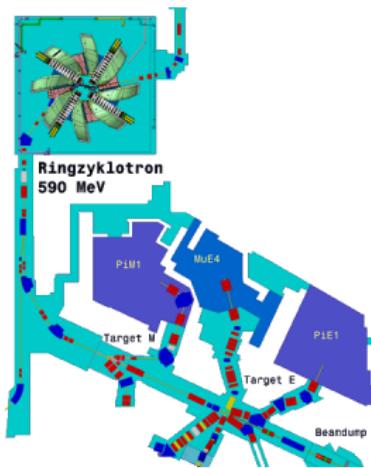

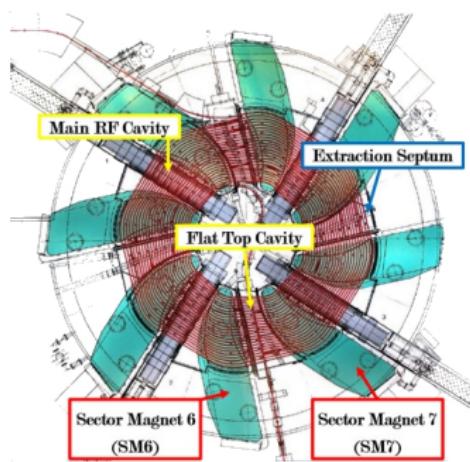

## Section 2

### Test Site & Setup

## Test Site

- High Intensity Proton Accelerator (HIPA) at PSI
- beam line PiM1
- positive pions ( $\pi^+$ ) with momentum of 260 MeV/c
- tunable particle fluxes from  $\mathcal{O}(1 \text{ kHz/cm}^2)$  to  $\mathcal{O}(10 \text{ MHz/cm}^2)$

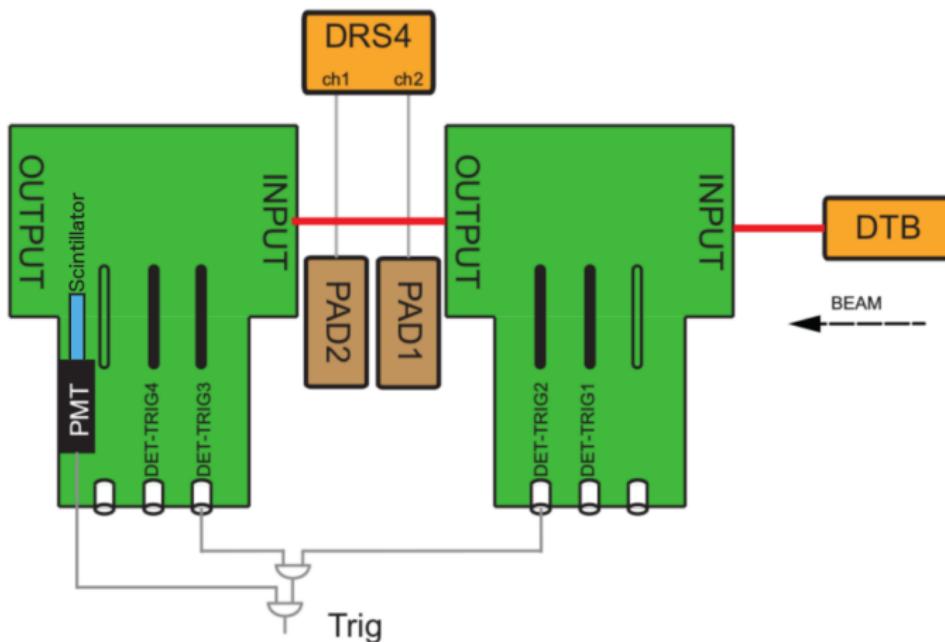

# Setup

Figure: Modular Beam Telescope

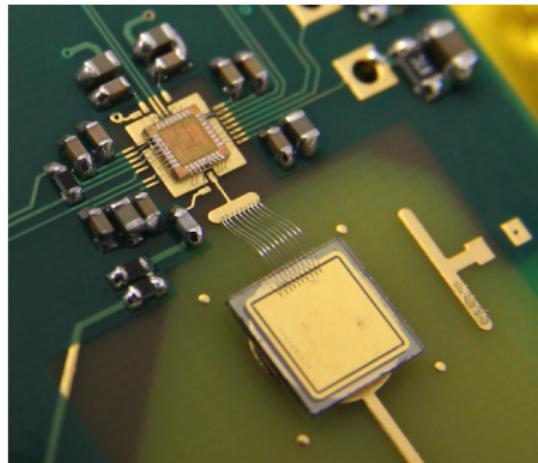

- 4 tracking planes → trigger (fast-OR) with adjustable effective area
- diamond pad detectors in between tracking planes
- low time precision of fast-OR trigger
- fast scintillator for precise trigger timing →  $\mathcal{O}(1\text{ ns})$

## Schematic Setup

- PSI DRS4 Evaluation Board as digitiser for the pad waveforms
- global trigger: coincidence of two telescope planes closest to DUTs and scintillator

# Pad Detectors

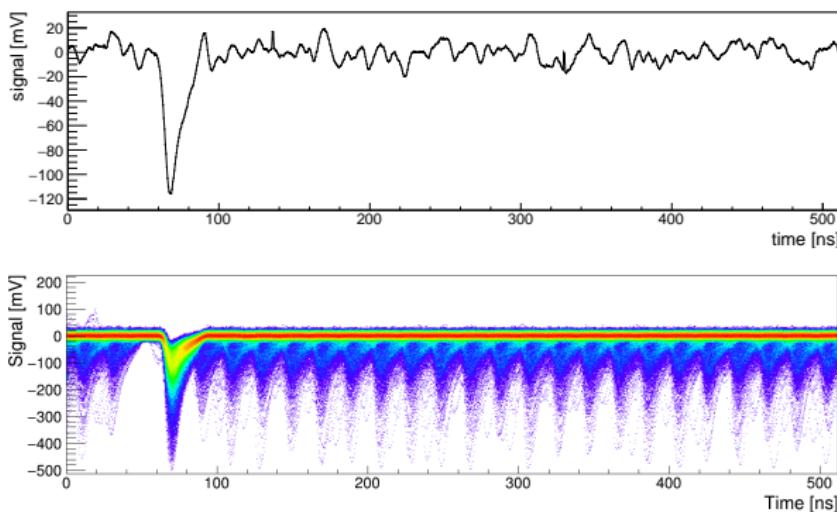

- building the detector: cleaning, photo-lithography and Cr-Au metallisation
- gluing to PCBs in custom built amplifier boxes
- connecting to low gain, fast amplifier with  $\mathcal{O}(5\text{ ns})$  rise time

## Section 3

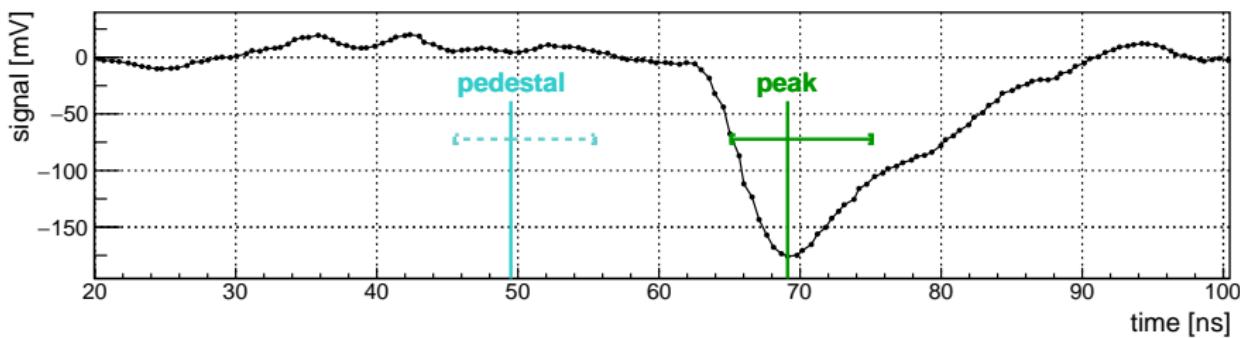

### Analysis

## Waveforms

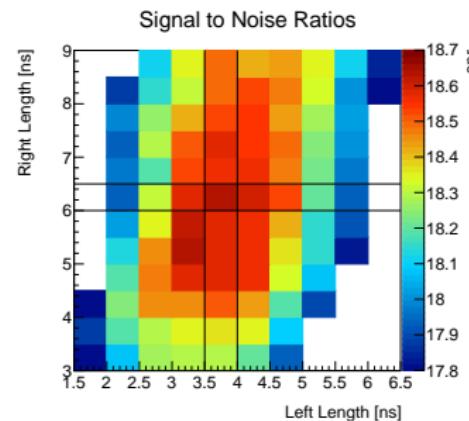

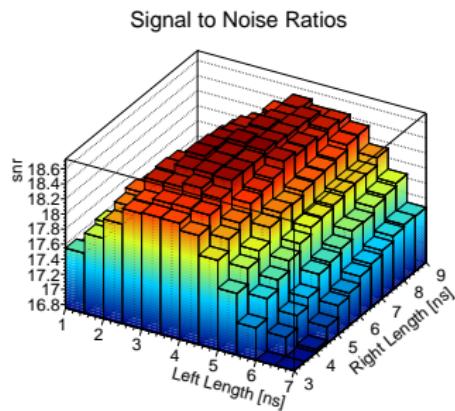

- most frequent peak ( $\sim 70$  ns): signal from triggered particle
- other peaks originate from particle of other bunches
- resolve bunch spacing of PSI beam:  $\sim 19.8$  ns
- signals in pre-signal bunch forbidden  $\rightarrow$  noise extraction

## Signal Definition & Calculation

- define signal region:  $\sim \pm 10 \text{ ns}$  around peak of the triggered signal  $\rightarrow [60 \text{ ns}, 80 \text{ ns}]$
- signal: finding the peak in the signal region and integrate around it  $[-4 \text{ ns}, 6 \text{ ns}]$
- pedestal: integrate with same lenght (10 ns) in the centre of the pre-trigger bunch  $[40 \text{ ns}, 60 \text{ ns}]$

# Signal To Noise Ratio

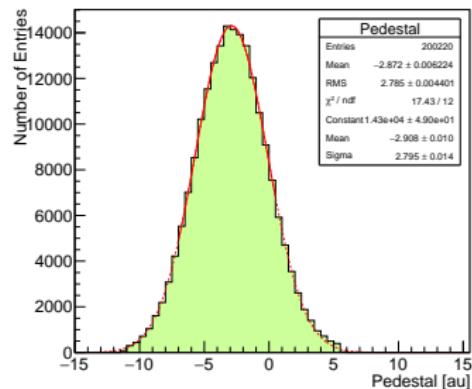

- optimise SNR by scanning the integral width in both directions
- flat plateau around the FWHM of the waveform peak

## Section 4

### Results

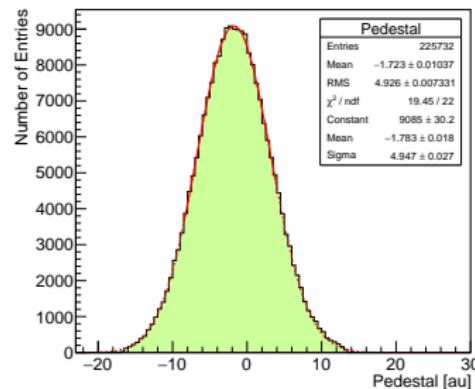

# Noise Distributions at $\sim 10 \text{ MHz}/\text{cm}^2$

Pedestal Distribution

(a) scCVD with 6 dB attenuation

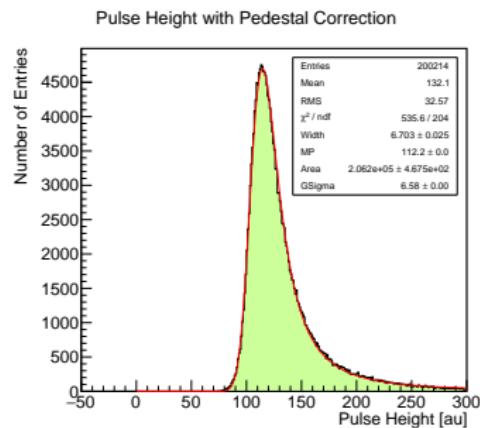

Pedestal Distribution

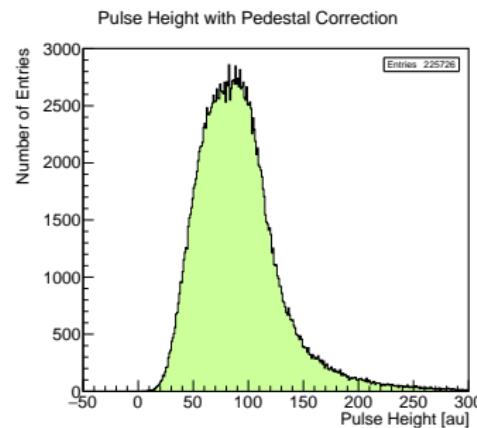

(b) pCVD

- noise distribution agrees well with Gaussian even at high rates
- extract noise by taking the sigma of the Gaussian fit
- noise similar for scCVD and pCVD diamond

# Signal Distributions at $\sim 10 \text{ MHz/cm}^2$

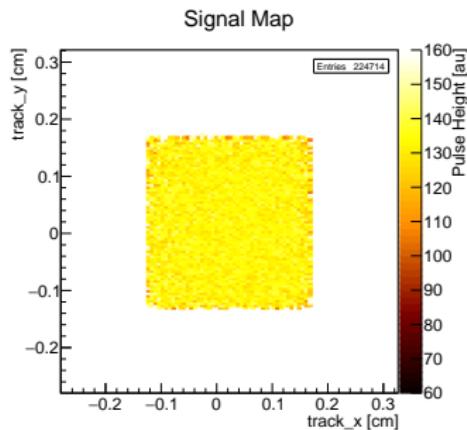

(a) scCVD with 6 dB attenuation

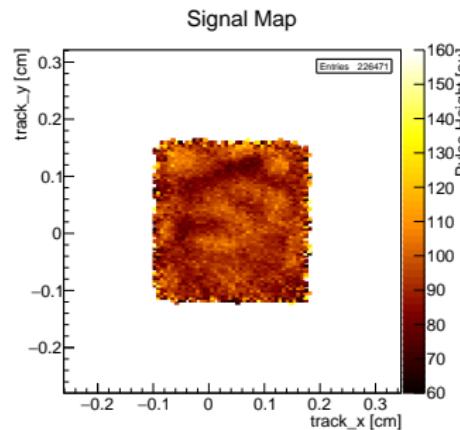

(b) pCVD

- signal gets corrected by the mean of the noise (baseline offset)
- pCVD signal smaller and smeared by different regions in the diamond

# Signal Maps

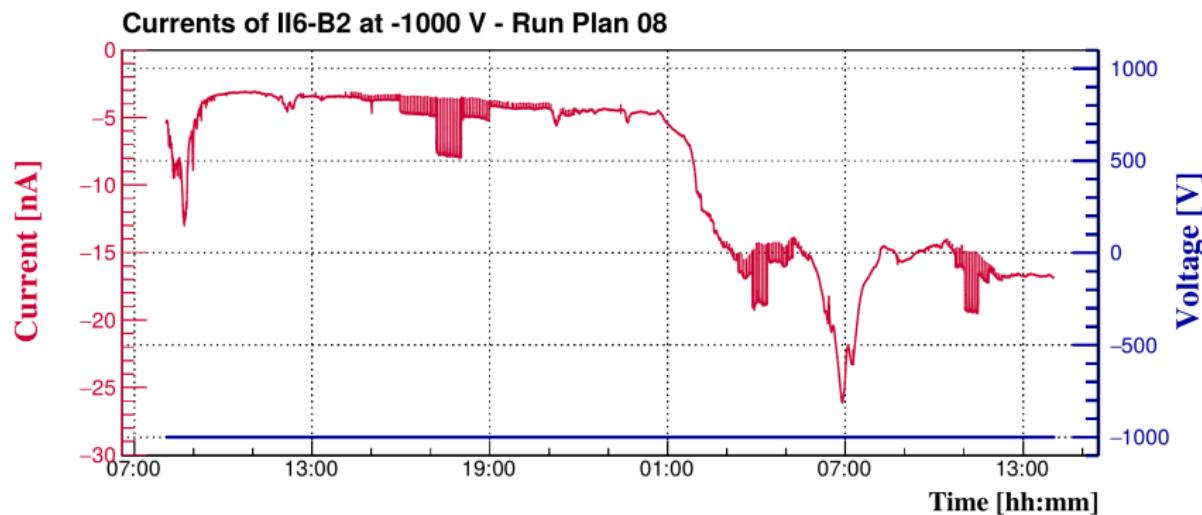

(a) scCVD with 6 dB attenuation

(b) pCVD

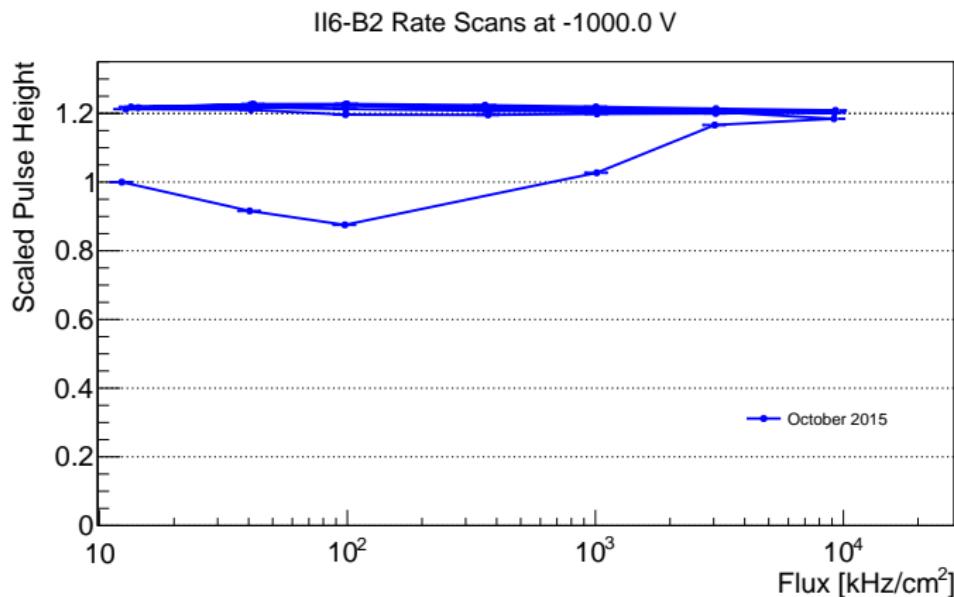

- flat signal distribution in scCVD
- signal response depending on region in the pCVD

## Currents

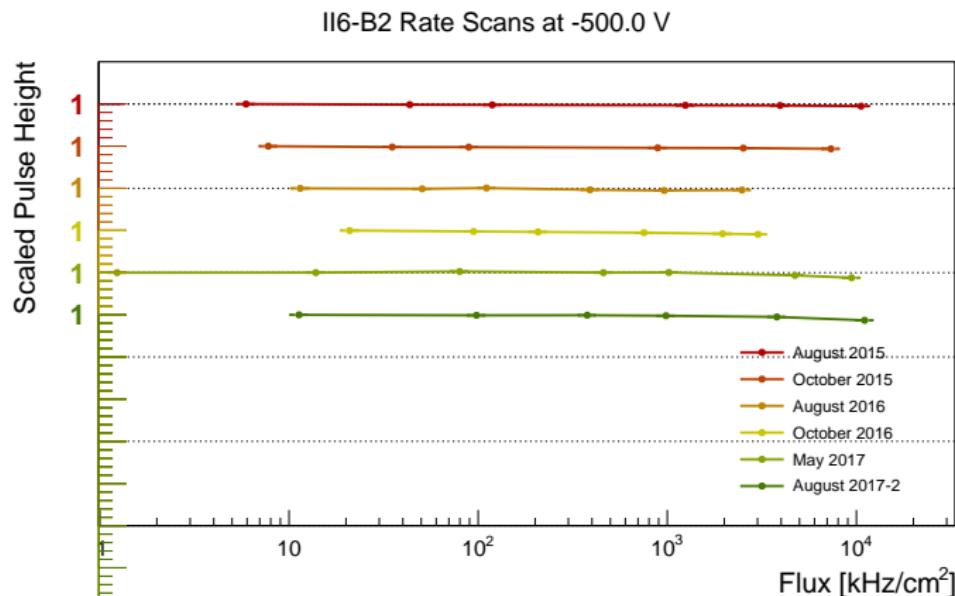

- typical rate scans for  $\sim 30$  h with rates up to  $\sim 20$  MHz/cm $^2$
- beam induced current clearly visible
- low leakage currents ( $< 30$  nA) at a bias voltage of  $-1000$  V ( $2$  V/ $\mu$ m)

## Rate Studies

- systematically checking several up and down scans
- also random scans to rule out systematic effects

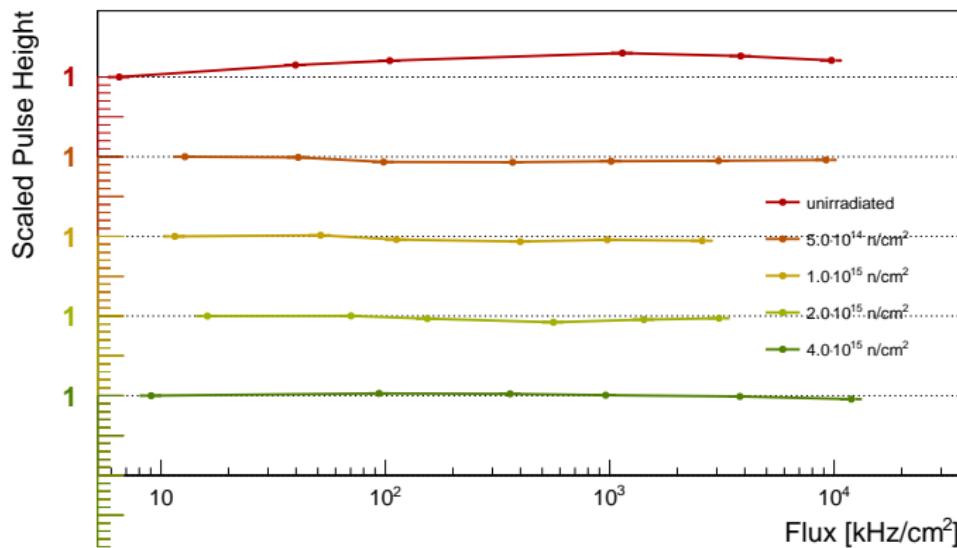

## Rate Studies in Non-Irradiated scCVD

- scCVD as reference in all beam tests
- all scans scaled to 1 and shifted for display
- scCVD diamond shows now rate dependence within the measurement precision

# Rate Studies in Irradiated pCVD

II6-B2 Rate Scans at -1000.0 V

- all scans scaled to 1 and shifted for display
- pulse height very stable after irradiation
- noise stays the same of:  $\sigma \approx 4.9$  au

## Section 5

### Conclusion

## Conclusion

- built beam test setup to characterise the rate behaviour of diamond pad detectors
- pCVD diamond show different signal response depending on the position in the diamond
- nonirradiated scCVD show no rate dependence
- detectors with irradiated pCVD diamond sensors can be built which have a rate dependence below 2% up to a flux of  $20 \text{ MHz}/\text{cm}^2$
